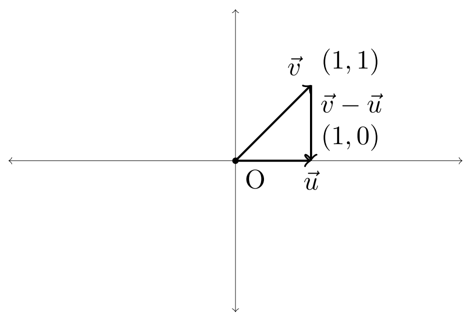
Calculus II

1 Vectors

$\mathbb{R}$ represents the set of real numbers.
$\mathbb{R}^2$ represents a 2 dimensional real plane.

$$\mathbb{R}^2 = \{(x, y) \mid x, y \in \mathbb{R}\}$$



Normally elements of $\mathbb{R}$ are known as scalers.
We can
· add (or subtract) two vectors
· if $c \in \mathbb{R}$ and $v \in \mathbb{R}^2$, $c\vec{v}$

1.1 Dot Product

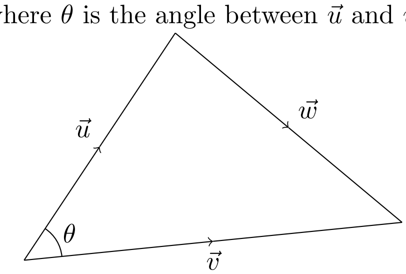
$u = (u_1, u_2)$ and $v = (v_1, v_2)$

$$u.v = u_1.v_1 + u_2.v_2$$

Theorem

$$u.v = |u||v|\cos(\theta)$$

where θ is the angle between $\vec{u}$ and $\vec{v}$ and $|u|$ is the length of vector $\vec{u}$



Proof:

$$w^2 = u^2 + v^2 - 2|u||v|\cos(\theta) \ldots (1)$$

$$\vec{w} = \vec{v} - \vec{u}$$
$$w = (v_1 - u_1, v_2 - u_2)$$
$$w^2 = (v_1 - u_1)^2 + (v_2 - u_2)^2$$
$$w^2 = v_1^2 - 2v_1u_1 + u_1^2 + v_2^2 - 2v_2u_2 + u_2^2$$
$$w^2 = v^2 + u^2 - 2v_1u_1 - 2v_2u_2 \ldots (2)$$

now, as (1) = (2)

$$u^2 + v^2 - 2|u||v|\cos(\theta) = v^2 + u^2 - 2v_1u_1 - 2v_2u_2$$
$$|u||v|\cos(\theta) = v_1u_1 + v_2u_2$$
$$|u||v|\cos(\theta) = \vec{u}.\vec{v}$$

Hence proved.

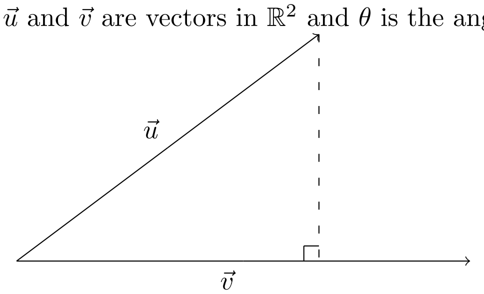
Extending the above theorem to $\mathbb{R}^n$: Consider $\vec{u} = (u_1, u_2, \ldots, u_n), \vec{v} = (v_1, v_2, \ldots, v_n) \in \mathbb{R}$
$$\vec{u}.\vec{v} = u_1v_1 + u_2v_2 + \cdots + u_nv_n$$

1.2 Unit Vectors

If $\vec{v} \in \mathbb{R}^2$ is a vector. then,
$$\hat{v} = \frac{\vec{v}}{|\vec{v}|}$$

1.3 Projections

If $\vec{u}$ and $\vec{v}$ are vectors in $\mathbb{R}^2$ and θ is the angle between them:



let $\vec{w}$ be the projection of $\vec{u}$ on $\vec{v}$

$$\vec{w} = |u|\cos(\theta)\hat{v}$$
$$\vec{w} = \frac{|u|\cos(\theta)|v|\vec{v}}{|v|^2}$$
$$\vec{w} = \frac{\vec{u}.\vec{v}}{|\vec{v}|^2}\vec{v}$$

1.4 Cross Product

Consider the vectors, u, v. Then the cross-product of u and v is defined as:

$$u \times v = |u||v| \sin(\theta)\hat{n}$$

where $\hat{n}$ is the unit vector perpendicular to the plane containing u and v, and also $(\vec{u}, \vec{v}, \hat{n})$ form a right handed system.

Properties of Cross Product:

- $\vec{u} \times \vec{v} = -(\vec{v} \times \vec{u})$
- $(r\vec{u}) \times (s\vec{v}) = rs\vec{u} \times \vec{v}$
- $\vec{u} \times (\vec{v} + \vec{w}) = \vec{u} \times \vec{v} + \vec{u} \times \vec{w}$

$\vec{u}$ and $\vec{v}$ can also be represented as:

$$\vec{u} = u_1\hat{i} + u_2\hat{j} + u_3\hat{k}$$

$$\vec{v} = v_1\hat{i} + v_2\hat{j} + v_3\hat{k}$$

$$\vec{u} \times \vec{v} = (u_2v_3 - u_3v_2)\hat{i} + (u_3v_1 - u_1v_3)\hat{i} + (u_1v_2 - u_2v_1)\hat{k}$$

$$\vec{u} \times \vec{v} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}$$

the above formula is only symbolic and meant to represent a cross product.

2 Multi-Variable Calculus

let $r : \mathbb{R} \to \mathbb{R}^3$ be a function. (It could be to any $\mathbb{R}^n$)
for $t \in \mathbb{R}$, $r(t)$ is a vector in $\mathbb{R}^3$

$$r(t) = f(t)\hat{i} + g(t)\hat{i} + h(t)\hat{i}$$

2.1 Continuity

r is continuous at a if:

$$\lim_{t \to a} r(t) = r(a)$$

i.e. $\forall \epsilon > 0, \exists \delta > 0$ such that $|t - a| < \delta \implies |r(t) - r(a)| < \epsilon$
or, if f, g and h are continuous at a, r is continuous at a.
